

# The `picture` package

Heiko Oberdiek\*

2020-04-22 v1.6

## Abstract

There are macro and environment arguments that expect numbers that will internally be multiplicated with `\unitlength`. This package extends the syntax of these arguments that dimens with calculation support can be added for these arguments.

## 1 User interface

### 1.1 Introduction

The environment `picture` and macros such as `\put`, `\line`, `\vector` and other macros have arguments that expect numbers that are used as factor for `\unitlength`. This package redefines such macros and adds code that detects whether such an argument is given as number or as length. In the latter case, the length is used directly without multiplying with `\unitlength`.

### 1.2 Options

Depending on the available features, also length expressions can be given. Option `calc` loads package `calc`. Then expressions of these package may be used. Otherwise `etex` wraps the length argument inside `\dimexpr... \relax`, if  $\varepsilon$ -`TEX` is available. Otherwise option `plain` uses plain assignments without calculation support.

The default is `calc` if package `calc` is loaded before package `picture`. If you specify option `calc` the loading of `calc` is ensured. Otherwise package `picture` looks whether `\dimexpr` is available and uses then option `etex` as default. If  $\varepsilon$ -`TEX` also could not be found, then `plain` is used.

### 1.3 Example

```

1 /*example)
2 \documentclass{article}
3
4 \usepackage[calc]{picture}
5
6 \begin{document}
7
8 \setlength{\unitlength}{1pt}
9
10 \begin{picture}(\widthof{Hello World}, 10mm)
11   \put(0, 0){\makebox(0,0)[lb]{Hello World}}%
12   \put(0, \heightof{Hello World} + \fboxsep){%
13     \line(1, 0){\widthof{Hello World}}%}
14   }%
15   \put(\widthof{Hello World}, 10mm){%
16     \line(0, -1){10mm}}%
17   }%
18 \end{picture}
19
20 \end{document}
21 
```

## 1.4 Supported packages

Packages `pspicture` and `pict2e` are supported, but they must be loaded before package `picture`.

New macros can be supported by `\picture@redefine`. The first argument is the macro which contains the arguments in its parameter text that you want to support by package `picture`. The second argument contains the parameter text. Change # to & for the arguments in question. Examples (already used by package `picture`):

```
\picture@redefine\put{(&1,&2)}  
\picture@redefine\line{(#1,#2)&3}
```

## 2 Implementation

### 2.1 Identification

```
22 (*package)  
23 \NeedsTeXFormat{LaTeX2e}  
24 \ProvidesPackage{picture} %  
25 [2020-04-22 v1.6 Dimens for picture macros (HO)]%

### 2.2 Options

```

28 \def\Pc@plainname{plain}
```

`\Pc@method` Macro `\Pc@method` stores the method to use for calculations. Check which features are available and set the default for `\Pc@method`.

#### 2.4.2 Package **pspicture**

Package **pspicture** changes the signature of `\oval` by adding an optional argument.

```

197 \@ifpackageloaded{pspicture}{%
198   \picture@redefine\@oval{[&1] (&2,&3)}%

## 3 Installation

### 3.1 Download

**Package.** This package is available on CTAN<sup>1</sup>:

`CTAN:macros/latex/contrib/picture/picture.dtx` The source file.

`CTAN:macros/latex/contrib/picture/picture.pdf` Documentation.

**Bundle.** All the packages of the bundle ‘picture’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

`CTAN:install/macros/latex/contrib/picture.tds.zip`

**TDS** refers to the standard “A Directory Structure for TeX Files” (`CTAN:pkg/tds`). Directories with `texmf` in their name are usually organized this way.

### 3.2 Bundle installation

**Unpacking.** Unpack the `picture.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip picture.tds.zip -d ~/texmf
```

### 3.3 Package installation

**Unpacking.** The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain TeX:

```
tex picture.dtx
```

**TDS.** Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

<code>picture.sty</code>	→ <code>tex/latex/picture/picture.sty</code>
<code>picture.pdf</code>	→ <code>doc/latex/picture/picture.pdf</code>
<code>picture-example.tex</code>	→ <code>doc/latex/picture/picture-example.tex</code>
<code>picture.dtx</code>	→ <code>source/latex/picture/picture.dtx</code>

If you have a `docstrip.cfg` that configures and enables `docstrip`’s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

### 3.4 Refresh file name databases

If your TeX distribution (TeX Live, MiKTeX, ...) relies on file name databases, you must refresh these. For example, TeX Live users run `texhash` or `mktexlsr`.

---

<sup>1</sup>`CTAN:pkg/picture`

### 3.5 Some details for the interested

**Unpacking with L<sup>A</sup>T<sub>E</sub>X.** The .dtx chooses its action depending on the format:

**plain T<sub>E</sub>X:** Run docstrip and extract the files.

**L<sup>A</sup>T<sub>E</sub>X:** Generate the documentation.

If you insist on using L<sup>A</sup>T<sub>E</sub>X for docstrip (really, docstrip does not need L<sup>A</sup>T<sub>E</sub>X), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{picture.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

**Generating the documentation.** You can use both the .dtx or the .drv to generate the documentation. The process can be configured by the configuration file ltxdoc.cfg. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfL<sup>A</sup>T<sub>E</sub>X:

```
pdflatex picture.dtx
makeindex -s gind.ist picture.idx
pdflatex picture.dtx
makeindex -s gind.ist picture.idx
pdflatex picture.dtx
```
